

ARKS RWA – Optimized Full Blueprint

Dual Trading, Trust-Gated + Equity Monetization Model

1. Canister Architecture (5 Core)

1. Core Platform Canister (ARKSRWA Core)

- Registers companies (name, symbol, valuation, metadata)
- Tracks verification state:
 - Registered, Pending, Verified, Caution, HighRisk, NeedsUpdate, Failed
- Orchestrates flows: triggers risk scans, creates tokens (via factory), runs primary sale (ICRC-1 transfers), lists on DEX, shows pool status
- Escrow for ICP/ckUSDC and company withdrawals (caps, schedules, approvals)
- Governance settings: thresholds, freshness windows, model versions, listing/delisting rules

2. Identity & Credential Canister Decentralized Identifiers + Verifiable Credentials (DID + VC)

- Issues and stores VC: VC:Registration , VC:ValuationUpdate
- Credential vault with selective disclosure
- Off-chain doc pointers (CID/hash + encryption ref)
- Revocation state

3. RiskEngine Canister

- HTTPS outcalls to news/search/social/registries
- Off-chain AI scoring
- Stores {score: 0-100, label, state, last_scored_at, next_due_at, explanation_hash}
- Lightweight badge API + full profile

4. TokenFactory Canister

- Versioned ICRC-1 WebAssembly(WASM) + cycles; spawns CompanyToken canisters
- Initializes minting/treasury (platform subaccount or company)
- Returns token_canister_id

5. CompanyToken Canister (ICRC-1, per company)

- Single source of truth for balances (private trades + DEX)
- Standard transfer/balance_of/metadata
- Optional mint freeze after primary sale

2. Monetization Model – Equity-Based Listing

Instead of charging an **upfront listing fee**, ARKS RWA will **take a small % equity allocation** in the company’s token supply upon listing.

Mechanism:

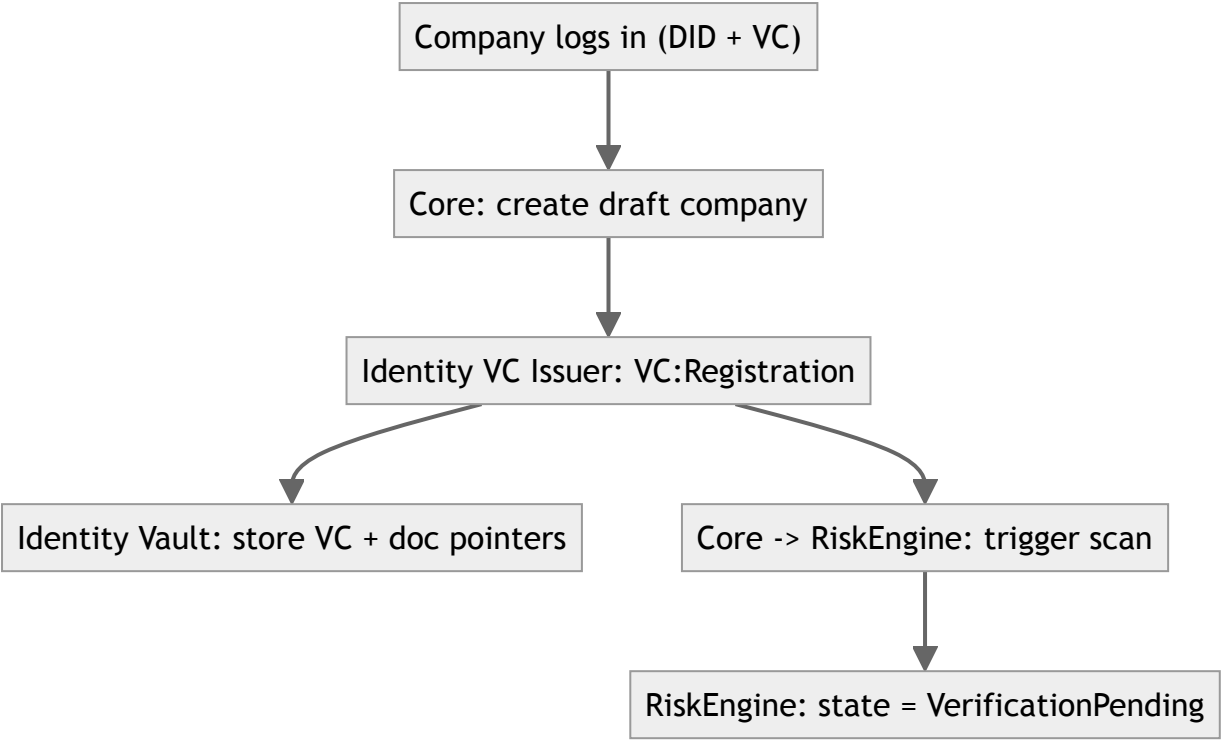

- On token creation, the company allocates **X% (e.g., 3–5%) of total token supply** to the platform treasury.
- Treasury-held tokens can be:
 - Staked in liquidity pools to earn swap fees
 - Sold gradually for revenue
 - Held long-term for upside as the company grows

Advantages:

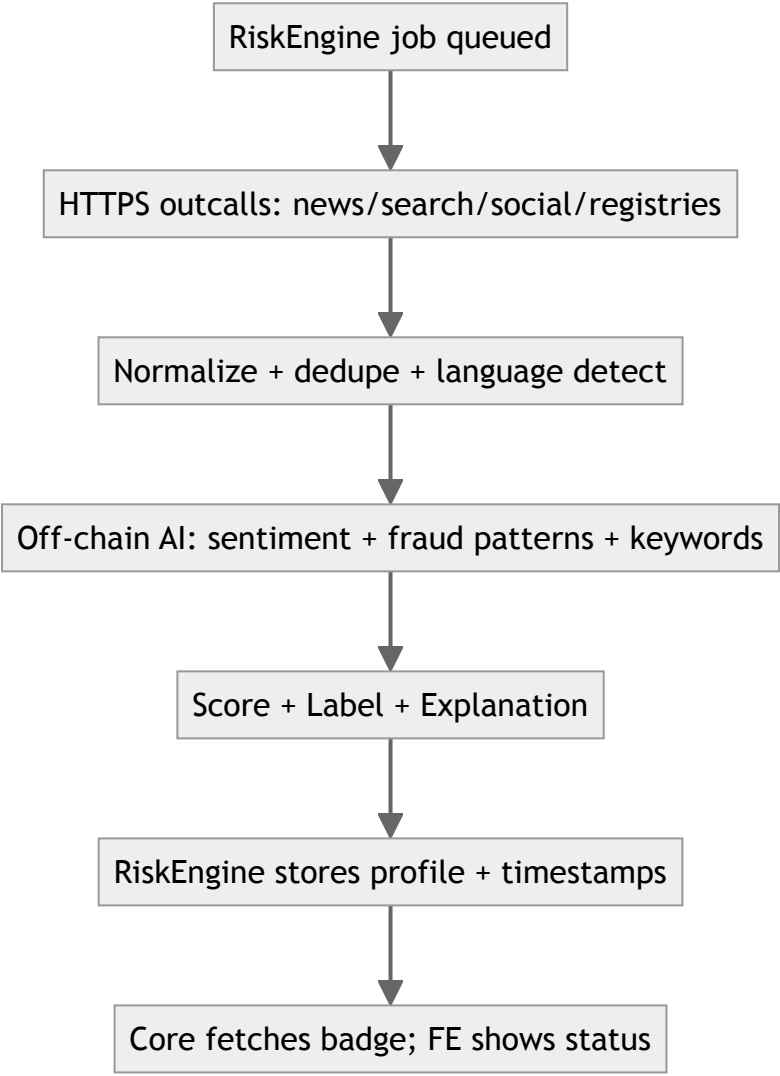

- No barrier for companies to join
- Revenue scales with token price & trading volume
- Aligns platform revenue with company success

3. End-to-End Platform Flows

A. Registration & Notarization (DID + VC)

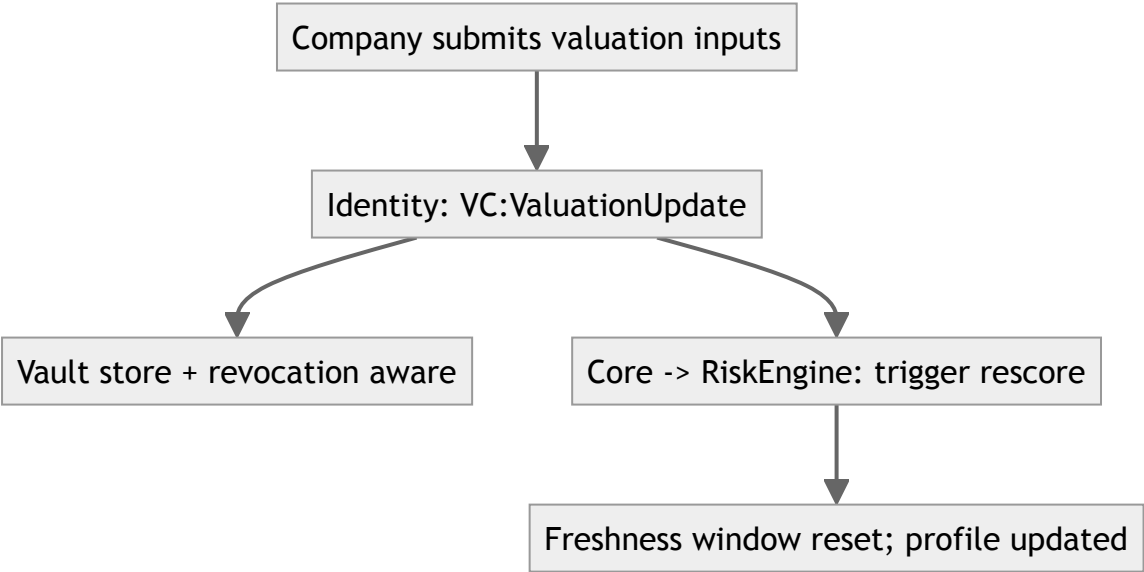

B. Reputation → AI Scoring → On-Chain Profile

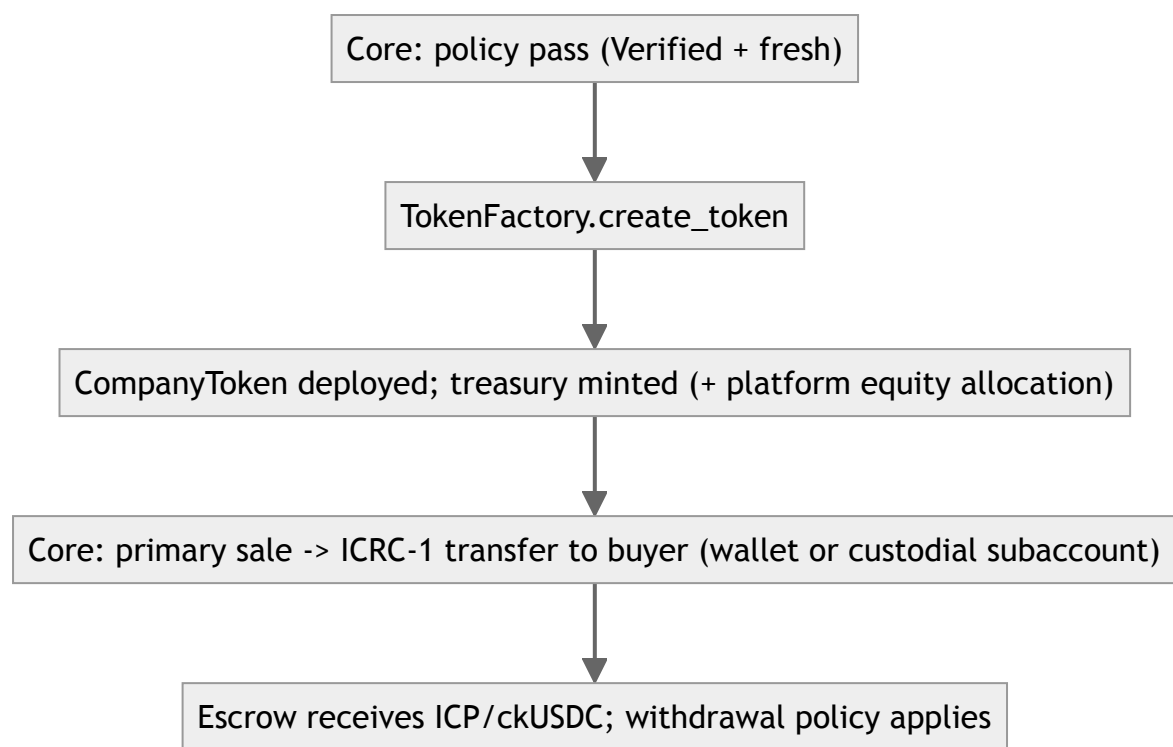

- Labels: Trusted (≥80), Caution (50–79), HighRisk (<50)
- States: Registered / VerificationPending / Verified / NeedsUpdate / Rejected / Failed

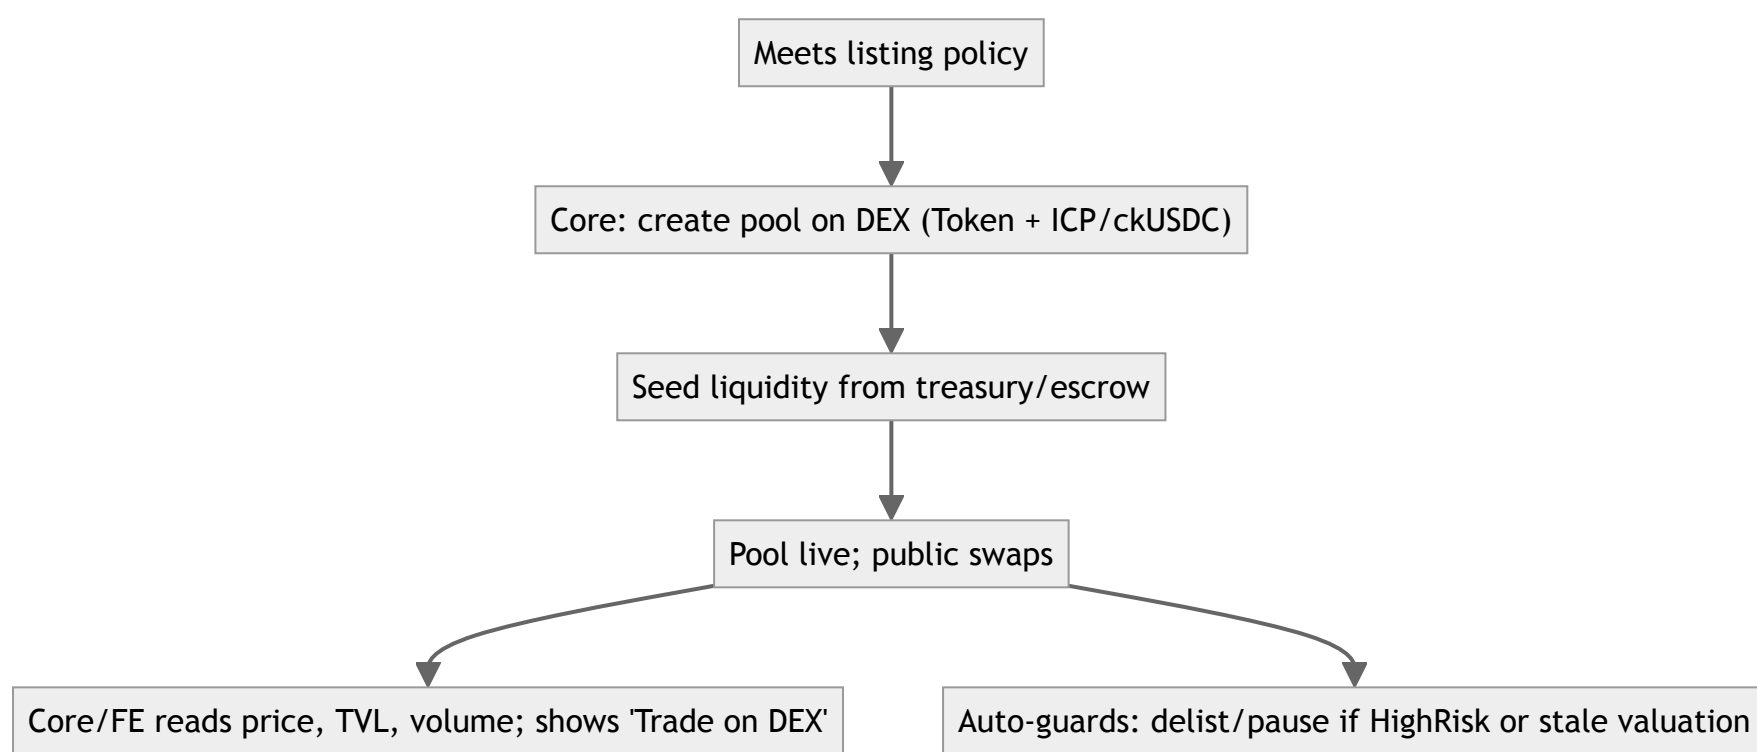

C. Valuation Updates (Freshness-gated)

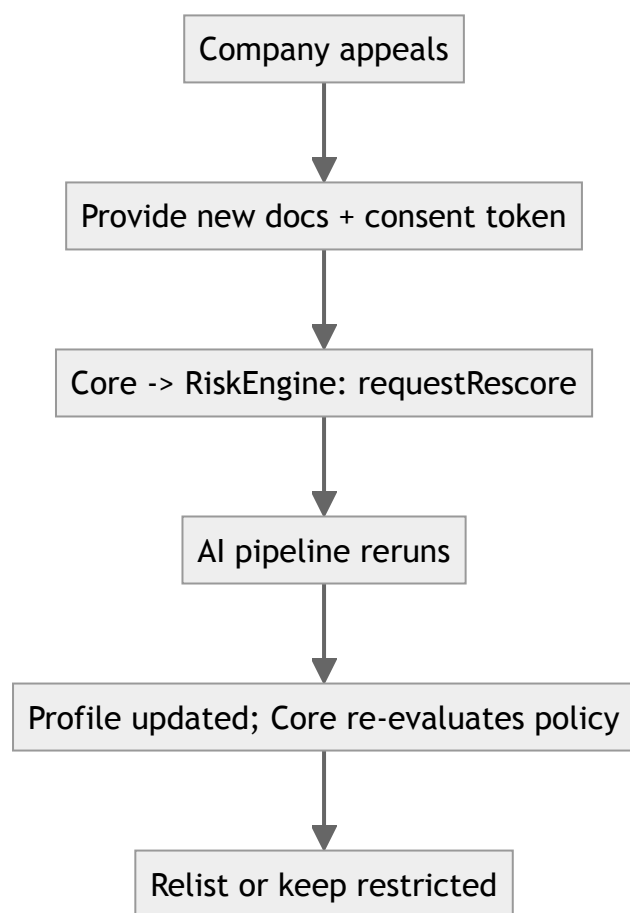

D. Tokenization & Primary Sale (Single Ledger: ICRC-1)

E. Public DEX Listing (AMM)

F. Appeals & Re-scoring

4. Frontend Data Model

- Company:** name, symbol, logo, description, valuation (USDT), token canister id, supply
- Verification Card:** state, label, score, last_scored_at, next_due_at, explanation (short), valuation_freshness
- Trading:** primary sale, private P2P (ICRC-1 transfers), DEX link + pool stats

- **Escrow/Withdrawals:** raised, withdrawn, remaining limit, next window

5. Security & Privacy

- **DID/VCs:** Issuer DID `did:icp:<issuerCanisterId>`, revocation checks, selective disclosure (SD-JWT/BBS+)
- **Docs/PII:** encrypted off-chain; on-chain only hash/CID/enc-ref; consent tokens; audited access
- **RiskEngine:** outcalls with retry/backoff; store score/label/state/timestamps/explanation-hash only; scheduled rescans
- **Trading:** single-ledger ICRC-1; optional custodial subaccounts; auto-guards on risk/freshness
- **Escrow:** withdrawal caps/cadence/approvals; LP tokens tracked if platform LPs
- **Governance:** thresholds, freshness windows, model versions, provider allowlist, listing rules; audit logs

6. Minimal Interfaces (shape only)

- **Core:** `register_company`, `get_company`, `get_verification`, `go_live`, `primary_buy`, `list_on_dex`, `get_pool_state`
- **Identity:** `issue_registration_vc`, `issue_valuation_vc`, `revoke`, `present_vc`, `add_doc_pointer`
- **RiskEngine:** `trigger_scan`, `request_rescore`, `get_profile`, `get_state`
- **TokenFactory:** `create_token(name, symbol, decimals, total_supply, treasuryAccount)` → `token_canister_id`
- **CompanyToken (ICRC-1):** standard ICRC-1

7. Benefits

- **Investors:** transparent trust (badge/score), dual access (private + DEX), escrow discipline
- **Companies:** easy registration with VCs, raise privately then list, appeals/rescore path
- **Platform:** no upfront fees → easier onboarding, equity stake aligns incentives, fewer canisters, strong governance

8. Rollout Plan

Sprint 1 (Week 1) – Core Trading & Tokenization

Goal: MVP trading with private sale & DEX option

Must Deliver:

- Core Canister (registration, tokenization, primary sale, escrow)
- TokenFactory (spawns CompanyToken)
- CompanyToken (ICRC-1)
- DEX integration (manual liquidity funding)
- FE: company list, buy/sell, DEX link

Sprint 2 (Week 2) – Verification & Risk Awareness

Goal: Add trust layer for public launch

Must Deliver:

- RiskEngine (mock scoring first)
- Identity Canister (minimal VC issuing)
- Core integration (block DEX listing if unverified)
- FE: verification card, warnings for HighRisk tokens

Result in 2 Weeks

- Public-facing platform with:
 - Company registration → token creation → private sale → DEX listing
 - Visible verification state + basic risk scoring
 - Escrow protection for funds
 - Equity-based monetization baked in

Comments
